A FEW SUGGESTIONS ON THE CULTURE OF PEONIES

OUR many years experience in growing the Peony, indicates that a well divided root that has from three to five eyes or buds is the best for planting. We send out only large, well developed plants.

Peonies may be planted in the spring, although fall planting is by far the most satisfactory. Plants sent out and planted in the fall will no doubt produce blooms next summer; however, the true value of the plant will not be apparent until the second season of bloom, and hasty judgment should be suspended if the showing the first season is not satisfactory.

In planting have your soil thoroughly prepared. It should be mellow and well drained, of good natural fertility, or aided by the use of thoroughly decayed manure well incorporated with the soil. No fertilizer should be allowed to come in direct contact with the roots. Make the hole deep and wide enough to accommodate the roots without being twisted or cramped.

The roots should be placed in the hole so that the buds are about 2 inches below the surface when the ground has settled around them. Too deep planting will result in a good growth of foliage but no blooms; the plant will be "blind".

A mulch of straw or leaves is very beneficial during the first winter. This should be removed in the spring before growth starts.
